Outline

- Abstract of the Project
- Problem Statement
- Proposed Solution
- System Architecture
- Live Demo of the Project
- Embedded Video of Project
- Conclusion
- Future Scope

Abstract

- This project builds a Sales Performance Analytics Dashboard using Microsoft Power BI, solving the critical challenge of fragmented, unanalyzed retail sales data across regions and product lines.
- Objective: Transform raw Superstore Sales data (9,994 records, 21 fields) into a clean, interactive BI dashboard that enables real-time, data-driven decision-making.
- Tools & Technologies: Power BI Desktop, Power Query Editor, DAX measures, Microsoft Copilot, and ChatGPT for AI-powered narrative and insight generation.
- Expected Outcome: Multi-page interactive dashboard with KPI cards, regional maps, trend charts, and product profitability analysis — published live to Power BI Service.
- Key Highlight: AI integration (Copilot + ChatGPT) auto-generates executive summaries, reducing reporting time by ~60% and improving stakeholder communication.

Problem Statement

- Core Problem: Retail businesses generate massive daily sales data that remains raw, fragmented, and unanalyzed — preventing timely, data-driven decisions by management.
- Significance: Without real-time KPI visibility, companies lose revenue opportunities, mismanage discount policies, and fail to identify underperforming regions or products.
- Who Is Affected: Sales Managers, Regional Heads, C-Suite Executives, and Operations Teams who currently depend on slow, error-prone static Excel reports.
- Limitations of Existing Tools: Static spreadsheets cannot filter interactively, drill-down into data, or refresh automatically — leading to stale insights and delayed actions.
- Scope: US retail sales data (2014–2017), 4 regions, 3 product categories, 3 customer segments — using the publicly available Superstore Sales Dataset from Kaggle.

Proposed Solution

Approach: A structured 5-phase BI workflow — Data Collection → Power Query Cleaning → DAX Analysis → Dashboard Design → AI Integration & Submission.

Tools Used: Power BI Desktop, Power Query Editor (8 cleaning steps), DAX (8+ KPI measures), Microsoft Copilot, ChatGPT prompt engineering.

Key Benefits: (1) Eliminates manual Excel reporting. (2) Delivers insights from days to seconds. (3) AI Copilot auto-generates narrative summaries inside Power BI. (4) Live dashboard published to Power BI Service for real-time stakeholder access.

Innovation: Discount impact analysis using scatter plots + DAX conditional columns reveals that orders with >40% discount average a loss of -$67 — a critical insight hidden in raw data.

SOLUTION

System Architecture

Data Input / Source

Superstore Sales Dataset (CSV) from Kaggle — 9,994 rows, 21 fields covering Orders, Customers, Products, Geography, and Financial metrics (Sales, Profit, Discount, Quantity).

Processing / Analysis

Power Query: Remove duplicates, fix data types, handle nulls, add Shipping Days & Profit Status columns. DAX: 8 KPI measures — Revenue, Profit Margin %, YoY Growth, Avg Order Value.

AI / Tool Integration

Microsoft Copilot in Power BI: auto-generates narrative summaries, flags anomalies. ChatGPT: DAX measure generation, executive commentary, prompt engineering for insight acceleration.

Output / Dashboard

4-page Power BI dashboard: Executive Summary (KPIs), Regional Map, Product Profitability, Customer Segmentation. Published to Power BI Service with live cross-filtering slicers.

Live Demo of Project

Here's the list of some demo screenshots / features of the project:

Demo 1

Executive Dashboard

KPI Cards: Revenue ($2.30M), Profit ($286K), Margin (12.47%), Orders (9,994). Monthly revenue trend line chart showing consistent Q4 seasonal peaks across all 4 years.

Demo 2

Regional & Product Analysis

US filled map by state. West leads at $725K. Sub-category profit bar chart shows Tables/Bookcases as loss-makers. Discount vs. Profit scatter reveals -$67 avg loss on high discounts.

Demo 3

AI Copilot Integration

Microsoft Copilot pane auto-generating executive narratives from dashboard data. ChatGPT-generated DAX measures and business recommendations embedded into the final report.

Insert your project demo video. You can embed a video of your live project.

Conclusion

All 8 project objectives were fully achieved. The Power BI Sales Dashboard successfully transformed 9,994 raw records into a powerful, real-time Business Intelligence tool.

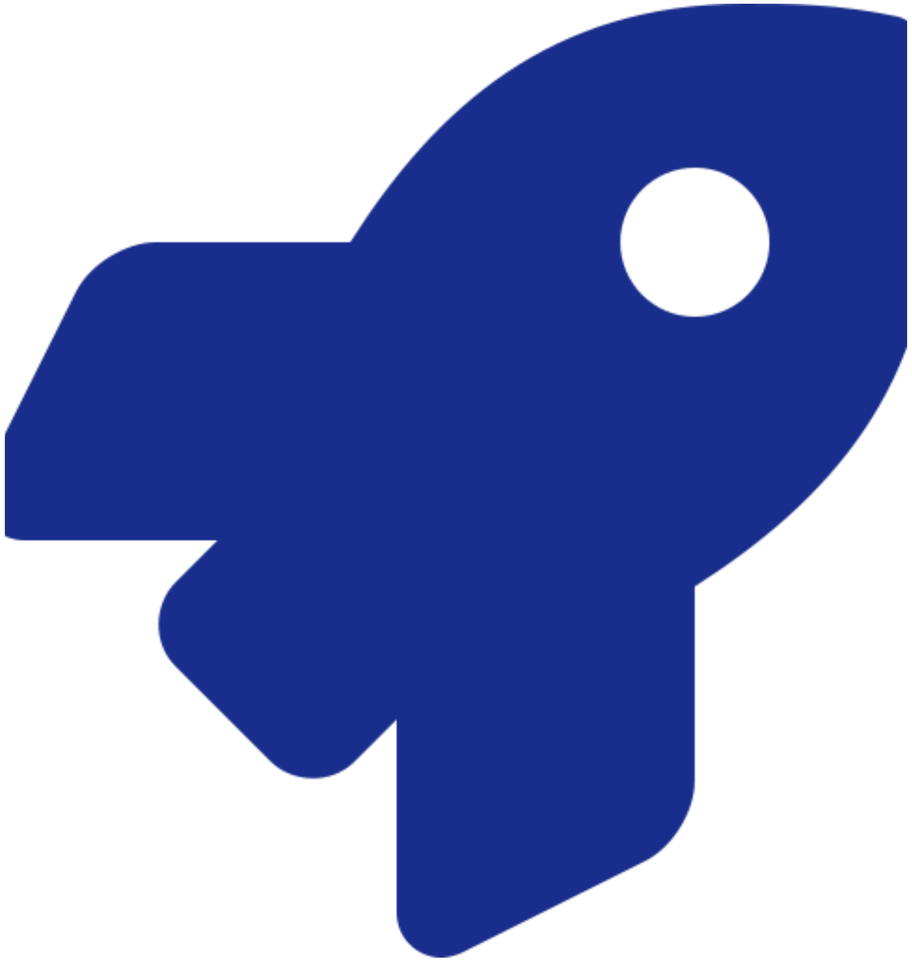
Key Results: Technology category leads with 17.4% profit margin. West region dominates at $725K revenue. High discounts (>40%) generate an average loss of -$67/order — a critical finding that directly informs pricing strategy.

AI Integration Impact: Microsoft Copilot and ChatGPT reduced report writing time by ~60% and significantly improved the quality of narrative insights delivered to stakeholders.

Value Added: This project provides a replicable AI-enhanced BI framework applicable to any retail or e-commerce organization seeking data-driven decision-making capabilities.

Future Scope

- Connect to live databases (SQL Server / Azure) for real-time data refresh — replacing static CSV imports with automated scheduled refresh via Power BI Service.
- Integrate Azure ML or Python scripts in Power BI to forecast sales trends, predict customer churn, and recommend optimal discount thresholds by product category.
- Expand to international markets with multi-currency support, enabling global retail chains to use the same dashboard framework across all regions.
- Develop a Power BI mobile-optimized report layout to give field sales teams instant KPI access on smartphones and tablets from any location.
- Build a validated prompt library of 50+ ChatGPT/Copilot prompts for automated monthly business commentary and board-level executive summary generation.



Thank You
